Build a complete, modern, production-ready food ordering website for a Malawi food business called **Pendo's Treats**.

IMPORTANT WORKING INSTRUCTIONS

You are working inside my current VS Code project folder.

First inspect the existing project and determine the current stack. If the project is empty, create a modern web application using:

- Next.js
- TypeScript
- Tailwind CSS
- App Router
- Lucide React icons

Do not stop after creating a basic template. Build the complete working website.

The website must be:

- Fully responsive
- Mobile-first
- Professional and visually attractive
- Fast loading
- Suitable for deployment on Vercel
- Structured with clean, reusable components
- Free from TypeScript and build errors
- Accessible
- Ready to run with `npm install` and `npm run dev`

Before finishing, run the build or type-check and fix all errors.

BUSINESS INFORMATION

Business Name: **Pendo's Treats**

Location: **Area 49, New Gulliver, Lilongwe, Malawi**

Phone / WhatsApp: **+265 994 630 808**

Display phone number as:

+265 (0) 994 630 808

Email:

kantembe.upendo@gmail.com

The business sells freshly prepared:

- Chicken Shawarma
- Chapati
- Chapati with eggs
- Samosa

MENU AND PRICES

Create these initial products:

Chicken Shawarma

Price: **MWK 4,500**

Description: Freshly prepared chicken shawarma filled with delicious chicken, fresh vegetables and tasty ingredients.

Chapati with 2 Eggs

Price: **MWK 3,000**

Description: Freshly prepared soft chapati served with two delicious eggs.

Plain Chapati

Price: **MWK 1,200**

Description: Fresh, soft and delicious homemade chapati.

Samosa

Price: **MWK 1,000**

Description: Freshly prepared crispy and delicious samosas.

Format all prices professionally, for example:

MWK 4,500

Do not use dollar signs.

WEBSITE DESIGN

The design should feel like a premium modern food brand.

Use a visual identity inspired by:

- Warm freshly cooked food
- Premium street food
- Modern restaurant ordering websites
- Clean food photography
- Friendly and appetizing presentation

Suggested design direction:

- Warm cream or off-white backgrounds
- Deep burgundy/red accent color
- Dark charcoal text
- Soft shadows
- Rounded cards
- Large food photography
- Smooth subtle animations
- Spacious layout
- Bold call-to-action buttons

Avoid making the website look like a generic AI-generated template.

The design should look polished enough for a real business.

LOGO AND BRANDING

Create a simple elegant text-based logo for:

PENDO'S TREATS

Include a small food-related icon or subtle graphic.

The logo should work well in:

- Navbar
- Footer
- Mobile view

- Future social media branding

Do not use copyrighted logos.

USE THE PROVIDED FOOD IMAGES

Inspect the project folder for the food images provided by the user.

Use the actual images throughout the website.

Organize them properly inside the project if necessary, for example:

`public/images/`

Use the images for:

- Hero section
- Menu cards
- Featured food section
- Gallery
- Background accents where appropriate

Do not distort the images.

Use proper object positioning and responsive image handling.

Create an attractive food gallery using the available photos.

WEBSITE PAGES

Build the following pages.

1. HOME PAGE

Create a premium landing page.

Navigation Bar

Include:

- Pendo's Treats logo
- Home

- Menu
- About
- Gallery
- Contact
- Cart icon with live item count
- Prominent "Order Now" button

The navbar should:

- Be responsive
- Have a professional mobile menu
- Become sticky when appropriate

HERO SECTION

Create a visually powerful hero section.

Headline:

Freshly Made. Deliciously Served.

Subheadline:

Enjoy delicious chapati, chicken shawarma and freshly prepared treats from Pendo's Treats in Area 49, Lilongwe.

Include two buttons:

1. Order Now
2. View Menu

Use one or more of the provided food images.

The hero section must look excellent on mobile.

Add subtle animations but do not overdo them.

FEATURED MENU SECTION

Show the four main products as beautiful cards.

Each card should include:

- Food image

- Product name
- Short description
- Price
- Add to Cart button

Use responsive grid layouts.

WHY CHOOSE US SECTION

Create attractive feature cards for:

- Freshly Prepared
- Delicious & Affordable
- Easy Ordering
- Convenient Location

Use Lucide icons.

HOW TO ORDER SECTION

Show a simple 3-step process:

1. Choose your favourite food
2. Add it to your cart
3. Send your order through WhatsApp

Make this section visually engaging.

LOCATION SECTION

Show:

Area 49, New Gulliver, Lilongwe

Include:

- Location icon
- Phone
- WhatsApp button
- Contact button

If a Google Maps embed cannot be accurately configured without coordinates, create a clean map placeholder or location card instead of inventing coordinates.

FINAL CTA

Create a strong section near the bottom.

Headline:

Hungry? Your Favourite Treat Is Just a Few Clicks Away.

Button:

Order Now

---

2. MENU PAGE

Create a dedicated menu page.

Include:

- Attractive page header
- All products
- Category filtering if useful
- Product cards
- Add to Cart functionality

Each product card should have:

- Image
- Name
- Description
- Price
- Quantity controls or Add to Cart button

Add subtle hover effects.

---

3. ABOUT PAGE

Create an About Pendo's Treats page.

Write natural, friendly marketing copy explaining that Pendo's Treats is passionate about preparing delicious and satisfying food for customers in Lilongwe.

Do not invent a fake founding date or history.

Include:

- Food images
- Brand values
- Fresh preparation
- Customer satisfaction
- Convenient ordering

---

4. GALLERY PAGE

Create a beautiful food gallery using the provided images.

Features:

- Responsive masonry or grid layout
- Click image to open a larger lightbox/modal
- Smooth transitions
- Mobile friendly

Do not show distorted images.

---

5. CONTACT PAGE

Include:

Visit Us

Area 49, New Gulliver, Lilongwe

Call or WhatsApp

+265 (0) 994 630 808

Email

kantembe.upendo@gmail.com

Add:

- Call button
- WhatsApp button
- Email link
- Contact form

The contact form should contain:

- Name
- Phone number
- Message

Since no backend email service has been configured yet, make the form clearly functional on the frontend and prepare it so a backend service can easily be connected later. Do not pretend that messages are being emailed unless an actual service is configured.

SHOPPING CART

Build a fully functional shopping cart.

Users must be able to:

- Add products
- Remove products
- Increase quantity
- Decrease quantity
- See item subtotal
- See total order amount
- Clear cart

Persist the cart using localStorage so it remains after page refresh.

Display the cart count in the navbar.

Use a cart drawer or dedicated cart page.

Make the cart experience excellent on mobile.

CHECKOUT / ORDER PAGE

Create a simple checkout process.

Collect:

- Customer Name
- Phone Number
- Order Type

Order Type options:

- Pickup
- Delivery

If Delivery is selected, show:

- Delivery Address / Location

Also include:

- Order notes

Show a complete order summary.

The customer should then click:

Place Order via WhatsApp

WHATSAPP ORDER INTEGRATION

Implement a working WhatsApp order button.

Use the business WhatsApp number:

265994630808

When the user clicks the button, generate a properly formatted WhatsApp message containing:

- Customer name
- Customer phone
- Order type
- Delivery address if applicable
- Ordered items
- Quantity of each item
- Price per item
- Total amount
- Order notes

Example:

Hello Pendo's Treats! 👋

I would like to place an order.

Customer Details Name: Jonathan Phone: +265 XXX XXX XXX Order Type: Pickup

My Order 1. Chicken Shawarma x 2 — MWK 9,000 2. Plain Chapati x 3 — MWK 3,600

Total: MWK 12,600

Notes: Please prepare it fresh.

Thank you!

Use a properly URL-encoded WhatsApp link.

Open WhatsApp in a new tab.

ADMIN PORTAL

Create an initial admin dashboard.

Use a route such as:

`/admin`

For now, create a simple frontend authentication screen.

Do NOT pretend this is secure production authentication.

Clearly structure the code so real authentication can later be added using Supabase, Firebase, Clerk, or another service.

After login, show an admin dashboard with:

Dashboard Overview

Show:

- Total products
- Available products
- Unavailable products
- Recent orders placeholder

Product Management

Allow the admin to:

- Add product
- Edit product
- Delete product
- Change price
- Change description
- Change availability
- Assign an image URL or local image reference

Because a database may not yet be configured, use a clean repository/service layer or local persistence so the project can later be migrated to Supabase without rewriting the UI.

Do not falsely claim that products are permanently stored in a production database if only localStorage or mock data is being used.

FUTURE-READY DATABASE STRUCTURE

Prepare the code so Supabase can easily be connected later.

Create sensible types/interfaces for:

Product

- id
- name
- description
- price
- image
- category
- available
- createdAt

Order

- id
- customerName
- phone
- orderType
- deliveryAddress
- items
- total
- notes

- status
- createdAt

OrderItem

- productId
- productName
- quantity
- price

COMPONENT STRUCTURE

Organize the project professionally.

Suggested structure:

- components/
- Navbar
- MobileMenu
- Footer
- Hero
- ProductCard
- CartDrawer
- CartItem
- OrderForm
- WhatsAppButton
- SectionHeading
- Gallery
- AdminSidebar
- context/
- CartContext
- lib/
- utils
- whatsapp
- storage
- types/
- product

- order
- data/
- products

Use reusable components instead of duplicating code.

USER EXPERIENCE REQUIREMENTS

The website must have:

- Smooth scrolling
- Responsive navigation
- Loading states where appropriate
- Empty cart state
- Form validation
- Helpful error messages
- Toast notifications for actions such as "Added to cart"
- Keyboard-friendly modal behavior
- Accessible buttons and labels
- Good mobile spacing
- Touch-friendly controls

SEO

Add proper metadata.

Website title:

Pendo's Treats | Fresh Chapati, Shawarma & Samosas in Lilongwe

Description:

Order delicious freshly prepared chapati, chicken shawarma and samosas from Pendo's Treats in Area 49, Lilongwe, Malawi.

Add:

- Open Graph metadata
- Appropriate page titles
- Semantic HTML

- Image alt text

FOOTER

Include:

Pendo's Treats

Freshly made. Deliciously served.

Links:

- Home
- Menu
- About
- Gallery
- Contact

Contact information:

Area 49, New Gulliver, Lilongwe

+265 (0) 994 630 808

kantembe.upendo@gmail.com

Add a WhatsApp quick-order button.

Add:

© 2026 Pendo's Treats. All rights reserved.

TECHNICAL REQUIREMENTS

- Use TypeScript properly
- Avoid `any` where possible
- Keep components clean
- Use reusable utility functions
- Do not leave broken imports
- Do not leave placeholder lorem ipsum text
- Do not create fake backend functionality
- Do not expose secrets

- Use environment variables for future API keys
- Ensure `npm run build` succeeds
- Fix all ESLint and TypeScript errors that prevent production build

---

FINAL QUALITY CHECK

Before you finish:

1. Inspect the entire project.
2. Ensure all pages are connected.
3. Test the navigation.
4. Test adding and removing products from the cart.
5. Test quantity controls.
6. Test localStorage cart persistence.
7. Test checkout validation.
8. Test WhatsApp message generation.
9. Test responsiveness for mobile, tablet and desktop.
10. Run the production build.
11. Fix all errors found.
12. Review the visual design and improve anything that looks unfinished.

Do not stop at planning or describing the implementation.

Actually create and modify all necessary files in the project.

When finished, provide a concise summary of:

- What was built
- Main files created
- How to run the project
- Any future steps required for a real database or secure admin authentication
